Course duration

5 days

Course Benefits

- Plan for the transformation with shared goals and timelines
- · Select a project and identify project metrics and KPIs
- · Create a team and agile organization structure
- Describe the benefits of using Source Control
- Migrate from TFVC to Git
- Scale Git for Enterprise DevOps
- · Recommend artifact management tools and practices
- Abstract common packages to enable sharing and reuse
- Migrate and consolidate artifacts
- Migrate and integrate source control measures
- Manage application config and secrets
- Develop a project quality strategy
- Plan for secure development practices and compliance rules
- · Implement and manage build infrastructure
- Explain why continuous integration matters
- Implement continuous integration using Azure DevOps
- Manage code quality including: technical debt, SonarCloud, and other tooling solutions
- Manage security policies with open source, OWASP, and WhiteSource Bolt
- Implement a container strategy including how containers are different from virtual machines and how microservices use containers
- Implement containers using Docker
- Inspect open source software packages for security and license compliance to align with corporate standards
- Configure build pipeline to access package security and license rating
- Configure secure access to package feeds
- Inspect codebase to identify code dependencies that can be converted to packages
- Identify and recommend standardized package types and versions across the solution
- Refactor existing build pipelines to implement version strategy that publishes packages
- Manage security and compliance
- Differentiate between a release and a deployment
- Define the components of a release pipeline
- Explain things to consider when designing your release strategy
- Classify a release versus a release process and outline how to control the quality of both
- Describe the principle of release gates and how to deal with release notes and documentation
- Explain deployment patterns, both in the traditional sense and in the modern sense
- Choose a release management tool
- Explain the terminology used in Azure DevOps and other Release Management Tooling
- Describe what a Build and Release task is, what it can do, and some available

deployment tasks

- Classify an Agent, Agent Queue, and Agent Pool
- Explain why you sometimes need multiple release jobs in one release pipeline
- Differentiate between multi-agent and multi-configuration release job
- Use release variables and stage variables in your release pipeline
- Deploy to an environment securely using a service connection
- Embed testing in the pipeline
- List the different ways to inspect the health of your pipeline and release by using alerts, service hooks, and reports
- Create a release gate
- Describe deployment patterns
- Implement Blue Green Deployment
- Implement Canary Release
- Implement Progressive Exposure Deployment
- · Configure crash report integration for client applications
- Develop monitoring and status dashboards
- Implement routing for client application crash report data
- Implement tools to track system usage, feature usage, and flow
- Integrate and configure ticketing systems with development team's work management
- Implement a mobile DevOps strategy
- Apply infrastructure and configuration as code principles.
- Deploy and manage infrastructure using Microsoft automation technologies such as ARM templates, PowerShell, and Azure CLI
- Describe deployment models and services that are available with Azure
- Deploy and configure a Managed Kubernetes cluster
- Deploy and configure infrastructure using 3rd party tools and services with Azure, such as Chef, Puppet, Ansible, SaltStack, and Terraform
- Define an infrastructure and configuration strategy and appropriate toolset for a release pipeline and application infrastructure
- Implement compliance and security in your application infrastructure
- Design practices to measure end-user satisfaction
- Design processes to capture and analyze user feedback from external sources
- · Design routing for client application crash report data
- · Recommend monitoring tools and technologies
- Recommend system and feature usage tracking tools
- Analyze alerts to establish a baseline
- Analyze telemetry to establish a baseline
- Perform live site reviews and capture feedback for system outages
- Perform ongoing tuning to reduce meaningless or non-actionable alerts

Microsoft Certified Partner

Webucator is a Microsoft Certified Partner for Learning Solutions (CPLS). This class uses official Microsoft courseware and will be delivered by a Microsoft Certified Trainer (MCT).

Course Outline

- 1. Planning for DevOps
 - 1. Transformation Planning
 - 2. Project Selection
 - 3. Team Structures
 - 4. Migrating to Azure DevOps
 - 5. Lab: Agile Planning and Portfolio Management with Azure Boards
- 2. Getting started with Source Control
 - 1. What is Source Control
 - 2. Benefits of Source Control
 - 3. Types of Source Control Systems
 - 4. Introduction to Azure Repos
 - 5. Introduction to GitHub
 - 6. Migrating from Team Foundation Version Control (TFVC) to Git in Azure Repos
 - 7. Authenticating to Git in Azure Repos
 - 8. Lab: Version Controlling with Git
- 3. Scaling Git for enterprise DevOps
 - 1. How to Structure your Git Repo
 - 2. Git Branching Workflows
 - 3. Collaborating with Pull Requests in Azure Repos
 - 4. Why care about GitHooks
 - 5. Fostering Inner Source
 - 6. Lab: Code Review with Pull Requests
- 4. Consolidating Artifacts & Designing a Dependency Management Strategy
 - 1. Packaging Dependencies
 - 2. Package Management
 - 3. Migrating and Consolidating Artifacts
 - 4. Lab: Updating Packages
- 5. Implementing Continuous Integration with Azure Pipelines
 - 1. The concept of pipelines in DevOps
 - 2. Azure Pipelines
 - 3. Evaluate use of Hosted vs Private Agents
 - 4. Agent Pools
 - 5. Pipelines and Concurrency
 - 6. Azure DevOps and Open Source Projects (Public Projects)
 - 7. Azure Pipelines YAML vs Visual Designer
 - 8. Continuous Integration Overview
 - 9. Implementing a Build Strategy
 - 10. Integration with Azure Pipelines
 - 11. Integrate External Source Control with Azure Pipelines
 - 12. Set Up Private Agents
 - 13. Analyze and Integrate Docker Multi-Stage Builds
 - 14. Lab: Enabling Continuous Integration with Azure Pipelines

- 15. Lab: Integrating External Source Control with Azure Pipelines
- 16. Lab: Integrate Jenkins with Azure Pipelines
- 17. Lab: Deploying a Multi-Container Application
- 6. Managing Application Config and Secrets
 - 1. Introduction to Security
 - 2. Implement secure and compliant development process
 - 3. Rethinking application config data
 - 4. Manage secrets, tokens, and certificates
 - 5. Implement tools for managing security and compliance in a pipeline
 - 6. Lab: Integrating Azure Key Vault with Azure DevOps
- 7. Managing Code Quality and Security Policies
 - 1. Managing Code Quality
 - 2. Managing Security Policies
 - 3. Lab: Managing Technical Debt with Azure DevOps and SonarCloud
- 8. Implementing a Container Build Strategy
 - 1. Implementing a Container Build Strategy
 - 2. Lab: Modernizing Existing ASP.NET Apps with Azure
- 9. Manage Artifact versioning, security & compliance
 - 1. Package security
 - 2. Open source software
 - 3. Integrating license and vulnerability scans
 - 4. Implement a versioning strategy (git version)
 - 5. Lab: Manage Open Source Security and License with WhiteSource
- 10. Design a Release Strategy
 - 1. Introduction to Continuous Delivery
 - 2. Release strategy recommendations
 - 3. Building a High-Quality Release pipeline
 - 4. Choosing a deployment pattern
 - 5. Choosing the right release management tool
- 11. Set up a Release Management Workflow
 - 1. Create a Release Pipeline
 - 2. Provision and Configure Environments
 - 3. Manage and Modularize Tasks and Templates
 - 4. Integrate Secrets with the release pipeline
 - 5. Configure Automated Integration and Functional Test Automation
 - 6. Automate Inspection of Health
 - 7. Lab: Configuring Pipelines as Code with YAML
 - 8. Lab: Setting up secrets in the pipeline with Azure Key vault
 - 9. Lab: Setting up and Running Functional Tests
 - 10. Lab: Using Azure Monitor as release gate
 - 11. Lab: Creating a release Dashboard
- 12. Implement an appropriate deployment pattern
 - 1. Introduction to Deployment Patterns
 - 2. Implement Blue Green Deployment
 - 3. Feature Toggles
 - 4. Canary Releases
 - 5. Dark Launching

- 6. AB Testing
- 7. Progressive Exposure Deployment
- 8. Lab: Feature Flag Management with LaunchDarkly and Azure DevOps
- 13. Implement process for routing system feedback to development teams
 - 1. Implement Tools to Track System Usage, Feature Usage, and Flow
 - 2. Implement Routing for Mobile Application Crash Report Data
 - 3. Develop Monitoring and Status Dashboards
 - 4. Integrate and Configure Ticketing Systems
 - 5. Lab: Monitoring Application Performance
- 14. Implement a mobile DevOps strategy
 - 1. Introduction to Mobile DevOps
 - 2. Introduction to Visual Studio App Center
 - 3. Manage mobile target device sets and distribution groups
 - 4. Manage target UI test device sets
 - 5. Provision tester devices for deployment
 - 6. Create public and private distribution groups
- 15. Infrastructure and Configuration Azure Tools
 - 1. Infrastructure as Code and Configuration Management
 - 2. Create Azure Resources using ARM Templates
 - 3. Create Azure Resources using Azure CLI
 - 4. Create Azure Resources by using Azure PowerShell
 - 5. Desired State Configuration (DSC)
 - 6. Azure Automation with DevOps
 - 7. Additional Automation Tools
 - 8. Lab: Azure Deployments using Resource Manager Templates
- 16. Azure Deployment Models and Services
 - 1. Deployment Modules and Options
 - 2. Azure Infrastructure-as-a-Service (IaaS) Services
 - 3. Azure Platform-as-a-Service (PaaS) services
 - 4. Serverless and HPC Computer Services
 - 5. Azure Service Fabric
 - 6. Lab: Azure Automation laaS or PaaS deployment
- 17. Create and Manage Kubernetes Service Infrastructure
 - 1. Azure Kubernetes Service
 - 2. Lab: Deploying a multi-container application to Azure Kubernetes Service
- 18. Third Party Infrastructure as Code Tools available with Azure
 - 1. Chef
 - 2. Puppet
 - 3. Ansible
 - 4. Terraform
 - 5. Lab: Infrastructure as Code
 - 6. Lab: Automating Your Infrastructure Deployments in the Cloud with Terraform and Azure Pipelines
- 19. Implement Compliance and Security in your Infrastructure
 - 1. Security and Compliance Principles with DevOps
 - 2. Azure security Center
 - 3. Lab: Implement Security and Compliance in an Azure DevOps Pipeline

- 20. Recommend and design system feedback mechanisms
 - 1. The inner loop
 - 2. Continuous Experimentation mindset
 - 3. Design practices to measure end-user satisfaction
 - 4. Design processes to capture and analyze user feedback
 - 5. Design process to automate application analytics
 - 6. Lab: Integration between Azure DevOps and Teams
- 21. Optimize feedback mechanisms
 - 1. Site Reliability Engineering
 - 2. Analyze telemetry to establish a baseline
 - 3. Perform ongoing tuning to reduce meaningless or non-actionable alerts
 - 4. Analyze alerts to establish a baseline
 - 5. Blameless Retrospectives and a Just Culture

Class Materials

Each student will receive a comprehensive set of materials, including course notes and all the class examples.

Class Prerequisites

Experience in the following is required for this Azure DevOps Services class:

 Fundamental knowledge about Azure, version control, Agile software development, and core software development principles. It would be helpful to have experience in an organization that delivers software.
